Open Source Decentralized Network
Ensuring Provenance for Digital Media
Created by Humans & AI

Bofu Chen

CTO & Founder

Open-source Developer

Delivering Accessible, Trustworthy & Verifiable Content

By indexing and storing on-chain data we are able to create comprehensive digital media histories that can be traced back to its origins

Why Blockchain?

Immutable

Records are on the blockchain and immutable. Which helps in building the foundation of the trust.

Transparent

All records are transparent and are easily accessible. ERC standards allow all open-sourced developers to build together.

Ecosystem

Can leverage the Web3 ecosystem including the decentralized storage, allowing users own their own data, and the broader creativity economy such as NFT.

Numbers Content Infrastructure

Capture SDK

Developer tools to allow developers adopt provenance standards such as IPTC, C2PA easily

Capture Cam

Mobile app for quickly taking photos with content integrity assured

Capture Dashboard

Manage and monitor tools to manage content and its metadata

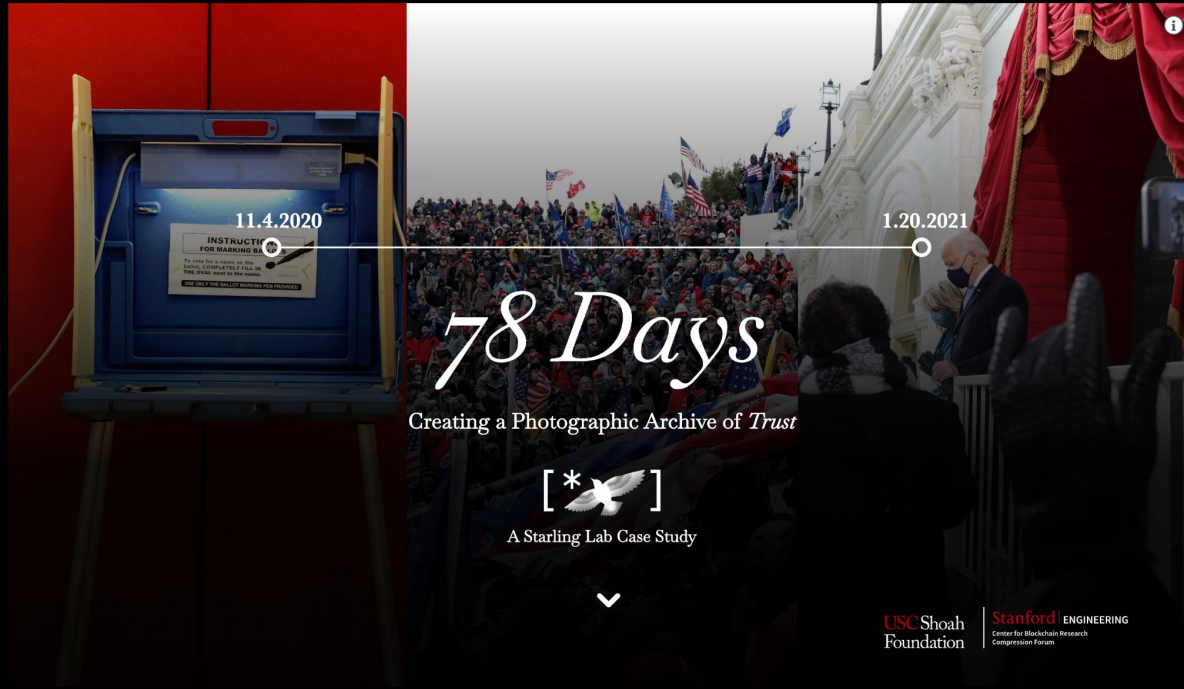

Blockchain Proof

Eco-friendly, fast and reliable blockchain

Use Case: 2020 US Post-Election Archive (Reuters)

Use Case: Ukrainian Children's Drawings (MISW Museum)

Use Case: War-crime Evidence (Rolling Stone)

Use Case: 318 Sunflower Protest Archive (哲攝, Taiwan)

Use Case: 2024 Election Archive (Local media outlets)

EIP-7053

Interoperable Digital Media Indexing

Fostering growth in the provenance space by committing to promoting open standards through EIP proposals

ERC-7053: Interoperable Digital Media Indexing  

A universal indexing method to record, discover and retrieve the history of digital media on EVM-compatible blockchains.

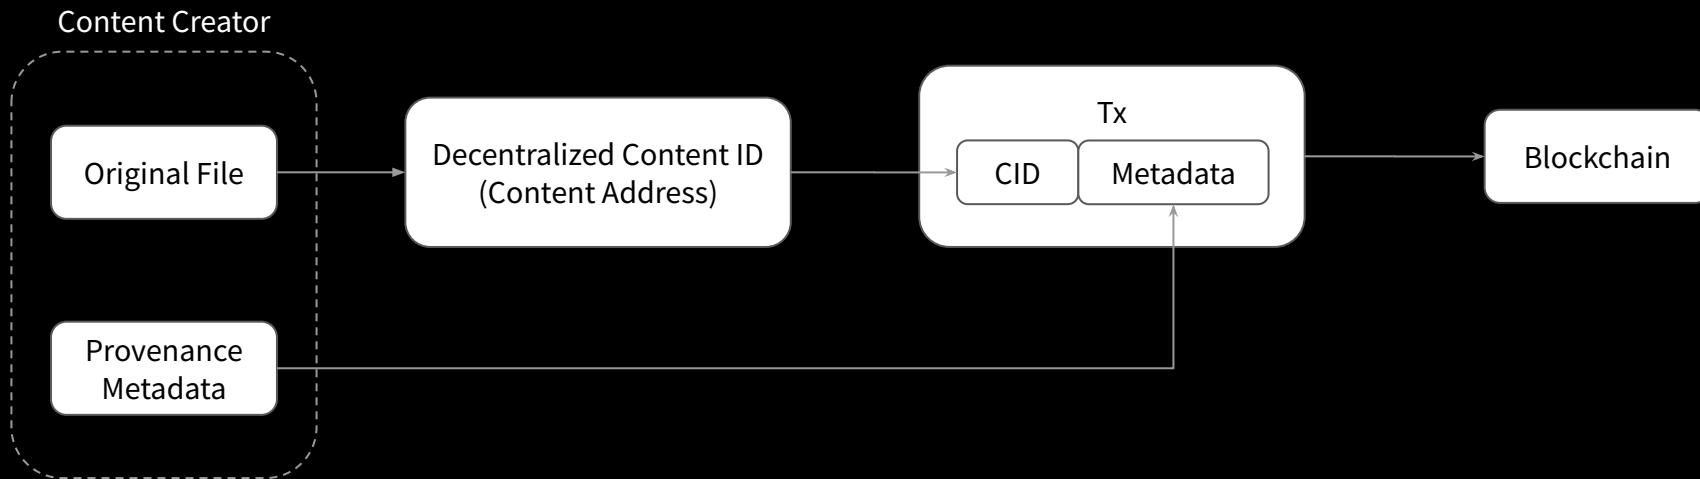

Authors Bofu Chen (@bafu), Tammy Yang (@tammyyang)

Created 2023-05-22

Nit: Git for Web3 Digital Assets

“Git” Web3 digital media helping to create on-chain provenance records in the form of tree structure we coined as Asset Tree

EIP-7517: Open for feedback

EIP-7517: Content Consent for AI/ML Data Mining

EIPs erc

bofuchen

7 Sep 2023

A proposal adding "dataMiningPreference" in the metadata to preserve the digital content's original intent and respect creator's rights.

This EIP proposes a standardized approach to declaring mining preferences for digital media content on the EVM-compatible blockchains. This extends digital media metadata standards like ERC-7053 and NFT metadata standards like ERC-721 and ERC-1155, allowing asset creators to specify how their assets are used in data mining, AI training, and machine learning workflows.

Motivation

As digital assets become increasingly utilized in AI and machine learning workflows, it is critical that the rights and preferences of asset creators and license owners are respected, and the AI/ML creators can check and collect data easily and safely. Similar to robot.txt to websites, content owners and creators are looking for more direct control over how their creativities are used.

This proposal aims to propose a standardized method of declaring these preferences. Adding `dataMiningPreference` in the content metadata allows creators to include the information about how they want their work whether the asset may be used as part of a data mining or AI/ML training workflow. This ensures the original intent of the content is maintained.

For AI-focused applications, this information serves as a guideline, facilitating the ethical and efficient use of content while respecting the creator's rights and building a sustainable data mining and AI/ML environment.
