

Acrobat and Reader Preference Settings for JavaScript

To allow the JavaScript to work correctly in automated PDFs some preference settings need to be adjusted. Do the following:

1. Click the 'Preferences' button below to open the Preferences panel.
2. Select 'JavaScript' from the list of Categories in the lefthand column.
3. Tick the option for 'Enable Acrobat JavaScript'.
4. Tick the option for 'Enable menu items JavaScript execution privileges'.
5. Remove tick from option for 'Enable global object security policy'.
6. Check that your first 3 JavaScript options match those that are indicated in the illustrations on the left.
7. Click the 'OK' button to accept.

IMPORTANT NOTE:

The "Global Security Policy" needs to be turned off to allow the JavaScript to work correctly for the interactive workflow chart (Workflow Tab). Other functions may work with the security policy on. But if you are concerned about this then open the Preferences after you have finished with the Image Metadata Handbook, and switch the "Global Security Policy" back on again.
